

El-Pac Electric Jack Systems- Switch Replacement Equalizer Systems part # 7779

The new switch has lugs that will only allow the wire terminals to be attached on one side of the lug only. This will require that the 2 outer terminals (A1 & A2) be attached and bent back over the attaching screw.

The two center terminals (B1 & B3) will be bent away from the screw. Black heat shrink tubing is included in the kit to help avoid contact with the other terminals and should be used on the white wires. A larger piece of red heat shrink tubing is supplied to go over the red wire and after the screw has been tightened, to cover the entire terminal including the screw. The terminals are labeled, and their location is the same as the original.

The old style switch is identified by a silver colored housing in the switch box. These instructions pertain to changing out this style. The new style switch has a gold colored housing in the box. This is a direct replacement and will not be necessary to use the additional heat shrink tubes.
