USAGE OF UNSEALED CONTROLLERS #2730U & #2745U

The #2730U and #2745U controllers are NOT SEALED UNITS and must be installed in an interior area protected from all weather and elements.

These may be used as replacements for 2730, 2745 and 2755.

Generally, the underside of a coach floor inside of a fully sealed storage compartment is preferred. The level sensor is inside of this controller; thus it must be installed firmly onto a solid structure that reacts well with the coach for Auto Level to properly work.

On the control box is an arrow designating UP and an arrow designating Front of Coach, these arrows must be followed.

The harness will exit to the rear of the coach.

On coaches or kits that originally used the prior sealed controller, a patch harness is needed EQ part # 6632R to make the transition. The multiple differing connectors make this possible. When completed wires passing through connector halves should mate up color to color.

After complete installation it will be necessary to set the Null for Auto Level to properly work. Instructions for this are located in the owners' manuals, it is that same as with the original. Also, there is a video on our web site showing the setting of the NULL
